

# **Giant cloud condensation nuclei and precipitation in marine clouds**

Piotr Dziekan, Jorgen Jensen, Wojciech Grabowski,  
Hanna Pawlowska

# Giant cloud condensation nuclei (GCCN)

- Aerosols with large dry radii, typically  $r_d > 1\mu\text{m}$
- Droplets formed on GCCN can easily grow to  $r > 20\mu\text{m}$  through condensation, hence they can initiate collision-coalescence
- Over oceans, small concentrations of sea-salt GCCN, of the order of 1/cc, are released from breaking waves

# LES with GCCN

- Marine stratocumulus (Dycoms RF02)
- Marine cumulus (RICO)
- Various GCCN and CCN concentrations
- University of Warsaw Lagrangian Cloud Model (UWLCM)
- Lagrangian microphysics (super-droplet method):
  - solute effect included in growth equation
  - explicitly modeled droplet activation
  - no numerical diffusion in size spectrum
  - CCN and GCCN have different hygroscopicities

# Precipitation vs GCCN conc.

stratocumulus

cumulus

- cloud droplet conc. = 30  $\text{cm}^{-3}$
- cloud droplet conc. = 45  $\text{cm}^{-3}$
- cloud droplet conc. = 105  $\text{cm}^{-3}$

- cloud droplet conc. = 35  $\text{cm}^{-3}$
- cloud droplet conc. = 55  $\text{cm}^{-3}$
- cloud droplet conc. = 75  $\text{cm}^{-3}$

# Cumulus - why rain is not sensitive to GCCN?

- GCCN affect rain, because they are seeds for large droplets that collide efficiently with smaller droplets
- Maybe in cumuli large droplets are formed even without GCCN?
- We test this by comparing concentrations of droplets with  $r > 25 \mu\text{m}$  in Sc and Cu that have similar cloud base precipitation

# Sc vs Cu - concentration of large droplets

# Comparison with observations

observation	LES without GCCN	LES with GCCN
<sup>1</sup> Sc: 0.04 mm/h cloud base precip. $N_{GCCN}=1.89/cc$	0.004 mm/h	0.03 mm/h
<sup>2</sup> Sc: from 0.24 mm/d to 0.46 mm/d surface precip. Surface wind speed 9.5m/s	0.01 mm/d	a) 0.22 mm/d $N_{GCCN} = 1.89/cc^1$ b) 0.13 mm/d $N_{GCCN} = 0.82/cc^4$
<sup>3</sup> Cu: no effect of GCCN on precipitation	Very low sensitivity of precipitation to GCCN

# Conclusions

- Wave-released giant sea-salt aerosols:
  - significantly increase precipitation in marine stratocumuli, in particular for moderate CCN concentrations
  - do not have much impact on precipitation in marine cumuli, because marine cumuli produce small concentrations of large droplets even without GCCN
  - production of large droplets in cumuli depends on SGS motion of droplets; Is this a physical or numerical effect? Any benchmark on SGS motion of Lagrangian particles?
